```
The gene cluster nisABTCIPRK (see AAT29660 and AAT29661) of Lactococcus lactis includes the nisA gene coding for pre-nisin A (AAR95267, see also AAR95263) and the genes for nisin modification, secretion and immunity. nisB (AAR95268) and nisC (AAR95270) are believed to be involved in reactions that modify pre-nisin; nisT (AAR95269) is similar to a transport ATPase and is involved in translocation of nisin out of the cell; nisI (AAR95271) is involved in immunity to nisin. Replacement of the natural, chromosomal copy of the nisA gene with a variant nisA gene allows prodn. of high levels of nisin A variants in Lactococcus lactis hosts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SdO

                                                                                              This is the nisin gene region of Lactobacillus lactis NIZO R5, including the nis A, nis B, nis T, nic C and nis I genes that respectively code for nisins A, B, T, C and I (see AAY06665-69). The invention relates to methods of enhancing performance in an animal by administering a bacterium capable of expressing a performance enhancing polypeptide such as nisin A or nisin Z. The enhanced performance results in improved growth rates and feed conversion efficiencies. The bacterium, which may be genetically modified to express the performance enhancing polypeptide, is sufficient to express the performance enhancing polypeptide, is a embryo or neonatal animal. If the polypeptide is nisin, it may also inhibit ruminal methane, decrease acetate to propionate ratios and prevent amino acid deamination. Administration of an appropriate bacterium which may act as a probiotic may also help control enteric pathogens in poultry. The polypeptide is produced continuously in the gut, maintaining a constant level. The protein is eventually degraded, leaving no residues in the meat.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                It contains a gene leader fragment encoding peptide leader sequence which induce post-translational modification (PTM) of amino acids Cys, Ser and Thr. The nisin gene was found in S. lactis using 20mer probe (see FT tag f). A DNA fragment is prepared encoding a precursor polypeptide attached to a leader fragment, this is then inserted into an expression vehicle to express and modify the precursor polypeptide. Modified proteins containing debydroalanine and debydrobutyrine which can covalently bind to targets, and adhesives for specific substrates can be designed. Tag b is claimed in the patent in claim 6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 518 BP; 187 A; 74 C; 89 G; 168 T; 0 other;

                                                                     bacteria e.g. strains of lactococcus lactis. It has efficient antimicrobial activity against a wide range of Gram positive bacteria which are food pathogens or spoilage organisms. The genes involved in nisin maturation can be used to transform other microbes which are unable to secrete the natural nish nisin. These organisms can however modify nisin and translocate it out of the cell. This provides an effective means of producing variant nisins which are useful as antimicrobial agents in conditions of high pH where natural nisin is ring-opened and lose its antimicrobial properties.

Example 2; Fig 4b; 29pp; English

This sequence represents the nisin A promoter isolated from Lactococcus CC lactis. This sequence is used to control the DNA fragment of the method CC of the invention. The method of the invention is for the controlled CC expression of a DNA fragment containing one or more genes of desired CC characteristics, in a lactic acid bacterium. The DNA fragment is under CC the control of a promoter for a microbial gene that encodes an CC expressed by the addition of a suitable inducer for transcription CC expressed by the addition of a suitable inducer for transcription CC expression of the DNA fragment causes the lysis of the microorganism CC used is an antimicrobial peptide produced by lactic acid bacterium. The CC expression of the DNA fragment causes the lysis of the microorganism CC used, or alternatively results in the release of intracellular proteins CC (such as enzymes, membrane proteins, extracellular proteins and CC used, or alternatively results in the release of intracellular proteins of rothe microorganism CC used, or alternatively results in the release of intracellular proteins of continuity of products containing a desired protein. The release of CC into the medium. The method can be used for the production of proteins of CC intracellular enzymes provides accelerated maturing of fermented CC the intracellular enzymes provides accelerated maturing of fermented CC into the can be used to determine the concentration of a inducer in CC addition of the inducer.

The present invention relates to a new method for controlling expression CC of a gene. The method of the invention involves providing a DNA fragment CC comprising a gene under transcriptional control of a promoter, where the CC promoter is obtained from a Gram-positive gene for an antimicrobial control of a precursor of the peptide. The gene is found in a gene CC cluster for the synthesis of the antimicrobial peptide and the promoter is inducible by the peptide. The antimicrobial peptide of the invention CC is acceptable in food products. The method provides a homologous CC expression system in Lactococcus, which is able to give strict/absolute cregulation of the gene expression using (in low concentrations) suitable inducers. High production of the desired protein, aminopeptidase N in experiments, gave a specific activity of 25000 nmol/mg/min using 0.5 g/l clisin A as the inducer, a level that has never been reached before by use of other (constitutive) promoters. The present nucleic acid sequence correspondents the nish promoter sequence of the invention.
                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                        Query Match

밁 S 밁 Ś 밁 S

Total DNA was isolated from the L. lactis strains NIZO 22186 and NIZO R5. With the aid of the nisA gene of strain NIZO R5 as a p. a 4.5 kb HindIII fragment was identified in the total DNA strain NIZO 22186, which was then cloned in M13 mpl8. The DNA sequence

sequence of a probe,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the gene for nisin Z production (nisZ) was determined by making use of oligos complementary to the 5 and 3 flanking sequences of the nisA gene. The nucleotide sequence of the nisZ gene is found to be identical to that of the nisA gene with the exception of a C to A transversion in posn. 148 which results in the replacement of AA HisZ7 by AsnZ7. The above indicate that the structure of nisin Z is as shown in AARZ8299.

Nisin Z (nis Z) gene region of Lactobacillus lactis companies to methods of a lanthionine-containing bacteriocin. The invention containing the containing bacteriocin. The invention containing the containing bacteriocin. The invention containing bacteriocin. The invention containing performance. The invention containing performance in an animal by administering a bacterium capable of expressing a performance containing polypeptide such as nisin A or nisin Z. The enhanced contained to the generically modified to efficiencies. The bacterium, which may be genetically modified to express the performance enhancing polypeptide, is administered to the gastrointestinal tract, especially to an embryo or meonatal continual. If the polypeptide is nisin, it may also inhibit ruminal methane, decrease acetate to propionate ratios and prevent amino caid deamination. Administration of an appropriate bacterium which may act as a probiotic may also had continuously in the gut, maintaining a constant level. The protein is eventually degraded, it leaving no residues in the meat.

The materials being treated to provide inhibition are preferably foods, although other materials can be treated. (Updated on 25-MAR-2003 to correct PF field.)

Inhibition of Gram-positive bacteria - using bacteriocin from Lactococcus lactis sub-species lactis NRRL B-18809 derived

The sequence is that of the bacteriocin LL-2 precursor gene, the precursor can be used in a method for the inhibition of Gram-positive bacteria. LL-2 is especially useful for treatment of food, although other non-food materials may also be treated.

(Updated on 25-MAR-2003 to correct PA field.)

This invention describes a novel plasmid (I), designated pCD6 for CC transformation of Clostridium difficile. The invention describes a method CC l) for (a) expressing a heterologous gene sequence in C. difficile which CC comprises providing a plasmid containing the heterologous gene sequence, introducing the plasmid into C. difficile, and optionally, where the CC plasmid also contains a gene coding for a selectable marker, selecting CC for C. difficile that express the selectable marker; (2) for making a CC difficile that express the selectable marker; (2) for making a CC omprises; (3) for identifying a C. difficile virulence factor which CC comprises culturing C. difficile in the absence of, and in the presence of a regulating factor that promotes expression of C. difficile virulence factors and identifying a putative virulence factor whose expression is reduced in the absence of the regulating factor; (4) for identifying a vector that integrates into a gram positive bacterial genome which CC comprises; (a) transforming a gram positive bacteria with a plasmid, where the plasmid includes a sequence of a inducer of the promoter, where the plasmid comprises an inducible promoter and replication of the transforming a gram positive bacteria with a plasmid the containing a gram positive bacteria with a plasmid the containing a gram positive bacteria where the promoter, and selecting for bacteria with a plasmid comprises an suppressible promoter and replication of the plasmid comprises an suppressible promoter and replication of the plasmid comprises an suppressible promoter and replication of the plasmid comprises an suppressible promoter and replication of the plasmid comprises and suppressible promoter and replication of the plasmid comprises and suppressible promoter and replication of the plasmid comprises and suppressible promoter and replication of the plasmid comprises and suppressible promoter and replication of the plasmid comprises and comprises and comprises contained the plasmid comprises contained the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             유사정
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           5

It has efficient antimicrobial activity against a wide range of Gram positive bacteria which are food pathogens or spoilage organisms. The genes involved in nisin maturation can be used to transform other microbes which are unable to secrete the natural nish nisin. These organisms can however modify nisin and translocate it out of the cell. This provides an effective means of producing variant nisins which are useful as antimicrobial agents in conditions of high pH where natural nisin is ring-opened and loses its antimicrobial properties. Variant nish genes were placed under the regulation of the lactose operon promoter ansd used to transform cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        09-NOV-1999

The year be produced by cultivation of transformed host cells an used e.g. as food preservatives to treat, kill or inhibit the growth of microorganisms and/or their spores.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAY31659) composed of a subtilin leader region and a subtilin-nisin fusion comprising residues 1-11 of Bacillus subtilis subtilin and residues 12-12 of Lactococcus lactis nisin. The chimera was not efficiently processed by B. subtilis into a functional lantibiotic. A heterogeneous mixture of products was produced, none of the products having the expected properties of a correctly processed polypertide. However, the mixture contained a minor component with

The sequences are useful as probes and primers for identification and/or detection of Listeria (e.g. as contaminants in foods, or mutational analysis) and for analysis of gene expression. Proteins encoded by the nucleic acid sequences can be used to screen for compounds that modulate gene expression, replication and pathogenicity of Listeria (potential therapeutic agents), also for
                                                                                                                                                                                                                                                                                                                                                                                                      anti-Listeria vaccines.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic fo directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

Sequence 19. Application US/08836687B

PATENT NO. 6448034

GENERAL INFORMATION:
APPLICANT: Gasson, Michael John
APPLICANT: Dodd, Helen Mair
TITLE OF INVENTION: PRODUCTION OF VARIANT NISIN
FILE REFERENCE: 20747/70

CURRENT APPLICATION NUMBER: US/08/836,687B

CURRENT FILING DATE: 1995-11-20

NUMBER OF SEQ ID NOS: 51

SOFTWARE: PATENTIN Ver. 2.1

SEQ ID NO 19
LENGTH: 300

TYPE: DNA

Sequence 25, Application US/08836687B

Patent No. 6448034

GENERAL INFORMATION:
APPLICANT: Gasson, Michael John
APPLICANT: Dodd, Helen Mair
TITLE OF INVENTION: PRODUCTION OF VARIANT NISIN
FILE REFERENCE: 207477/70

CURRENT APPLICATION NUMBER: US/08/836,687B
CURRENT FILING DATE: 1995-11-20
NUMBER OF SEQ ID NOS: 51
SOFTWARE: Patentin Ver. 2.1
SEQ ID NO 25
LENGTH: 300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            US-08-836-687B-23

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

APPLICANT: OLSTEIN, ALAN D.

APPLICANT: PERRTAG, JOSELEN

TITLE OF INVENTION: BACTERIOCIN-METAL COMPLEXES IN THE DETECTION OF

TITLE OF INVENTION: PATHOGENS AND OTHER BIOLOGICAL ANALYTES

FILE REFERENCE: 7005-0003

CURRENT APPLICATION NUMBER: US/10/082,618

CURRENT FILING DATE: 2002-02-22

NUMBER OF SEQ ID NOS: 8

SOFTWARE: PATENTIN Ver. 2.1

SEQ ID NO 8

LENGTH: 767

TYPE: DNA

ORGANISM: Streptococcus lactis
